

## Head Impact Protection Structure

A head impact protection structure is used in the pillar, garnish, and ceiling construction for the purpose of mitigating the impact to passengers heads in the event of a secondary collision. This new collision safe body has passed the standards set in the FMVSS201 regulations.

## Discharge Headlight

High visibility is provided using a color and intensity that resembles sunlight and with a light beam intensity three times the power of a halogen light.

In addition the Discharge Headlight (which consumes approximately 70% of the electric power of a halogen light) also reduces the burden on the battery.
